

ABSTRACT

5 A mixture having good thermal stability, flow and
moldability and suitable as a golf ball-forming material is
obtained when a resinous component including a base resin of
an ionomer resin or resins and optionally a non-ionomer
thermoplastic elastomer is blended with specific proportions
of a fatty acid and/or fatty acid derivative and a basic
10 inorganic metal compound capable of neutralizing acidic
groups left unneutralized in the base resin and fatty acid.
Using the same material, high-rebound golf balls can be
effectively manufactured.
